

Connected Graph

A graph is connected if every pair of vertices (nodes) of the graph are connected by a path (edge)

Disconnected Graph

A graph is disconnected if at least a pair of vertices (nodes) in the graph is not connected by a path (edge)

Single source shortest path (SSSP)

~~X~~ $A \rightarrow D \rightarrow 5$
 \checkmark $A \rightarrow C \rightarrow D \rightarrow 3$ (shortest path)

Dijkstra's Algorithm

- ① start node = 0, other nodes = ∞
- ② Visit unvisited node with smallest known distance from starting vertex.
- ③ For current vertex, examine its unvisited neighbours.

④ Relaxation

if $(d(v) > d(u) + d(w))$

assign $d(v) = d(u) + d(w)$

⑤ Update the previous vertex for each
update distance

⑥ Repeat step {②-⑤} until all vertices
are visited.

Here let $d(v) = 2$, $d(u) = 3$ and $w = 2$

$d(v) > d(u) + d(w)$

$$10 > 5 + 2$$

$$10 > 7$$

So let assign 7 in place of 10

(4) Relaxation

$$\text{if } (d(v) > d(u) + d(w))$$

$$\text{assign } d(v) = d(u) + d(w)$$

(5) Update the previous vertex for each update distance

(6) Repeat step {2} - {5} until all vertices are visited.

Here y is 5.
 $d(v) = 2$, $d(u) = 5$ and $w = 2$

$$d(v) > d(u) + d(w)$$

$$10 > 5 + 2$$

$$10 > 7$$

So let assign 7 in place of 10

	↓	s	t	x	y	z
visited		s	t	x	y	z
s		0	∞	∞	∞	∞
y			10	∞	5	∞
z			8	∞		7
t			8	13		
x				9		

	s	t	x	y	z
s	0	8	9	5	7

$s \rightarrow t$

$s \rightarrow x$

$t \rightarrow y \rightarrow s$

$x \rightarrow t \rightarrow y \rightarrow s$

so $s \rightarrow y \rightarrow t \rightarrow x$ so, $s \rightarrow y \rightarrow t \rightarrow x$
